In most cases, the Clostridium species rank among the sporogenic obligate anaerobes, which are sensitive to bitter hop substances and acidic pH. Thus they rank among the less dangerous contaminants in brewing operations. Their increased incidence in breweries can be linked to the modernization of technologies, which reduces access to oxygen in individual production phases.

Barley Brewing microbiology begins in the barley field, where plant-microbial interactions and the microbiological status of the grain both pre- and postharvest can have serious implications for brewhouse processing and beer quality. Although these microbes do not survive the malting and brewing processes, secretory factors may persist, affecting downstream quality. In the field, a vast range ...
