This special issue of Genetics Research International focuses on molecular genetics and cytogenetics in cancer. The hunt for informative disease-related genetic biomarkers may become so valuable for the differential diagnosis, prognosis, and disease monitoring of cancer patients that numerous researchers are committed to this challenge. Indeed, a colossal effort of current molecular medicine to progress in the understanding of the hallmarks of cancer is focusing on the field of biomarker ...

Cancer Cytogenetics: Chromosomal and Molecular Genetic ...

The cytogenetic and molecular genetic aspects that may be involved in the pathogenesis of bladder cancer are presented. Although anomalies of chromosome 9 may play an initial causative role in this cancer, the subsequent events, involving a succession of genetic changes, are less established or understood. This presentation is a distillation of what generally are considered to be the cytogenetic and molecular genetic events that constitute the array of changes underlying bladder cancer.

This section publishes research on the variety and impact of chromosomal aberrations on all types of human cancer. Manuscripts on animal models of tumors are also welcome. Case reports can only be considered if they provide a comprehensive review of the literature or describe an as yet-unreported finding in the corresponding malignancy. The exclusive use of molecular cytogenetic approaches (including array-CGH), or a combination of those with banding cytogenetics, standard molecular genetic ...

Cancer A Cytogenetic And Molecular Approach

Professor Sverre Heim has worked within the field of cancer cytogenetics for more than three decades. He has used chromosomal markers to trace the clonal relationships among neoplastic cell populations and determine their patterns of evolution. He has

described numerous specific chromosome abnormalities in various hematologic disorders and solid tumors, identified their gene-level consequences, and has shown that the karyotypic and molecular genetic abnormalities have diagnostic as well as ...

Cytogenetic and molecular analyses have provided extraordinary insights into the biology and pathogenesis of pediatric cancer and, in some cases, these insights have then formed the basis for more accurate assessment of diagnosis and prognosis. However, neither cytogenetic nor molecular methods are required routinely in the clinical setting. In some pediatric solid tumors, there is not yet a basis for genetic testing because recurrent genetic aberrations are unknown. In others, particularly ...

Cytogenetic and Molecular Pathology of Pediatric Cancer ...

Covers how molecular genetic data (PCR-based and sequencing information) are collated with the cytogenetic data where pertinent, Discusses how molecular cytogenetic data (based on studies using FISH, CGH, SNP, etc) are fused with karyotyping data to enable an as comprehensive understanding of cancer cytogenetics as is currently possible.

Cytogenetic abnormalities in lung cancer are very complex. However, a number of recurrent cytogenetic abnormalities have been identified. Many of these changes are common in both major histological groups of lung cancer while certain chromosomal abnormalities have been correlated with the stage or the grade of the tumors. In addition, several molecular alterations have been constantly found. Some of them are common in different histological subtypes of lung cancer and they appear ...

Cytogenetic and molecular aspects of lung cancer.

Discusses how molecular cytogenetic data (based on studies using FISH, CGH, SNP, etc) are fused with karyotyping data to enable an as comprehensive understanding of cancer cytogenetics as is currently possible. Cancer researchers, clinical oncologists, geneticists, and especially anyone interested in the translational aspects of bench-to-bedside research in cancer genetics will find this new ...

Molecular cytogenetics combines two disciplines, molecular biology and cytogenetics, and involves the analysis of chromosome structure to help distinguish normal and cancer-causing cells. Human cytogenetics began in 1956 when it was discovered that normal human cells contain 46 chromosomes.

Molecular cytogenetics - Wikipedia

The cumulative incidence of complete cytogenetic response (CGCR) with imatinib was 91%; however, the incidence of CGCR at 48 months into therapy was only 78%. Similarly, the incidence of major molecular responses (best cumulative vs landmark at 48 months) were 74% versus 62%, and of undetectable BCR-ABL transcripts 38% versus 24%.
