Cannulated Screw Fixation Principles And Operative Techniques

After adjustments to ensure anatomic approximation, two terminally threaded stainless steel 4.0-mm cannulated screw set K-wires with Suture Washers are used for fixation. To have the screw heads sit as far away medially from the humeral articular surface as possible, the wires are oriented medially and parallel to the joint surface. The transition between the autograft and native glenoid should be smooth visually and via palpation. A small bur is used to contour the transition if necessary ...

Cannulated Screw - an overview | ScienceDirect Topics

A solid fully-threaded 4.0 mm screw gives the strongest fixation. If there is not enough space, a smaller-diameter screw can be used, but this weakens the construct. If cannulated screws are used, there is an increased incidence of fixation failure and screw breakage. Cannulated screws are not as strong and tend to break with repeated bending forces.

Cannulated screw fixation and plate fixation have similar fixation effectiveness and functional outcomes in the treatment of displaced intra-articular calcaneus fractures. Due to the shorter duration of surgery and the low rate of complications, cannulated screw fixation is superior to plate fixation. However, further studies are needed to evaluate cannulated screw fixation for different Sanders types of calcaneus fractures.
