Hence, some clinical presentations that would ordinarily be dismissed in other equids must be considered as medical/surgical emergencies in the donkey. This article, the first in an occasional series discussing the clinical approach to problems in the donkey, describes the options for castration, and offers practical advice on how to avoid some common pitfalls and potentially fatal complications that are specific to this species.

### **Clinical approach to castration in the donkey | Research ...**

There are several studies that described the surgical techniques of equine castration such as (Mason et al., 2005, Sprayson and Thiemann, 2007) described the open castration with second intension...

In chemotherapy-naïve patients with metastatic castration-resistant prostate cancer (CRPC), abiraterone or enzalutamide is the recommended treatment option. Docetaxel is recommended for patients with metastatic CRPC, whereas radium-223 is recommended for those without visceral disease.

Despite these trials, immunotherapy for CSPC remains a preliminary approach for which biomarkers and clinical endpoints of efficacy are still needed. Nonhormonal Approaches With or Without Standard ADT. Preclinical data support the evaluation of a variety of nonhormonal agents in early PCa. In this respect, compounds directed at serum vascular ...

Cryptorchid testis being removed Inguinal or pre-scrotal testes are removed using a typical castration incision or by incising directly over the retained testis if it's location is far from the standard midline incision. A parapreputial skin and paramedian abdominal wall incision is often used for removal of abdominal testes in dogs.

### **Cryptorchid Castration - Approach | Veterinary Surgery**

Chemical castration is castration via anaphrodisiac drugs, whether to reduce libido and sexual activity, to treat cancer, or otherwise. Unlike surgical castration, where the gonads are removed through an incision in the body, chemical castration does not remove organs, nor is it a form of sterilization. Chemical castration is generally considered reversible when treatment is discontinued, although permanent effects in body chemistry can sometimes be seen, as in the case of bone ...

We conceived the co-clinical platform as an innovative approach to improve the design, speed and outcomes of rational and personalized clinical treatments 1. The power of this approach lies in harnessing data gained from pre-clinical studies performed in several genetic mouse models and combining it with the concurrent investigation of therapies,

either conventional or experimental, in human ...

### **A co-clinical approach identifies mechanisms and potential ...**

We show that castration counteracts tumor progression in a Pten loss-driven mouse model of prostate cancer through the induction of apoptosis and proliferation block. Conversely, this response is bypassed with deletion of either Trp53 or Zbtb7a together with Pten, leading to the development of castration-resistant prostate cancer (CRPC). Mechanistically, the integrated acquisition of data from mouse models and patients identifies the expression patterns of XAF1, XIAP and SRD5A1 as a ...

Castration of male ruminants is a common livestock management practice, but induces pain. However, little is known about the effectiveness of multimodal analgesia compared to local anesthesia (LA) alone in reducing pain associated with burdizzo castration in sheep. This study aimed to monitor the pain response induced by castration in sheep and to assess the efficacy of analgesia strategies. Twenty-four 12-month-old male Texel sheep were burdizzo-castrated after administration of ...

Diagnosis of metastatic castrate resistant prostate cancer (mCRPC) with current biomarkers is difficult and often results in unnecessary invasive procedures as well as over-diagnosis and over-treatment. There are a number of prognostic biomarkers for CRPC, but there are no validated predictive biomarkers to guide in clinical decision-making.

### **Clinical implication of prognostic and predictive ...**

Donkeys are often presented at an older age for castration with increased size of testes, increased quantities of scrotal and inguinal fat together with established sexual behaviour, all of which can cause postoperative complications. It is often better to opt for an inguinal approach rather than scrotal in these cases.

### **GUIDE TO DONKEY CASTRATION ANAESTHETIC PROTOCOL**

"The innovative trial design of IND234 will match men with metastatic castration resistant prostate cancer with agents designed to target their specific molecular abnormalities, in order to improve their outcomes." This sub-study is part of the IND.234 - Prostate Cancer Biomarker Enrichment and Treatment Selection (PC-BETS) Study. The primary endpoint is clinical benefit rate defined as ...

### **Treadwell Announces Initiation of New Clinical Trial of ...**

Castration (also known as orchietomy or orchidectomy) is any action, surgical, chemical, or otherwise, by which an individual loses use of the testicles: the male gonad. Surgical castration is bilateral orchidectomy (excision of both testicles), and chemical castration uses pharmaceutical drugs to deactivate the testes. Castration causes sterilization (preventing the castrated person or animal ...

alization algorithm predicting clinical outcomes in HSPC patients under therapy, based on a mathematical mechanistic model for PCa progression. Mathematical models have been widely employed to predict cancer progression and response to drugs in populations (e.g., [6,7]), We have recently introduced a new approach to PCa immunotherapy by

Background: The behaviour of the adult entire male horse is often undesirable and the

vastly eased management of the more biddable gelding means that clients often request castration of their horses. It can be an intimidating procedure due to the potential serious complications and the associated health and safety considerations. A good solid approach to the clinical aspects of castration and ...

### **Castration techniques in the horse - ResearchGate**

The overall aim of this grant is to generate data to understand and enable the development of a novel therapeutic approach for the treatment of patients with castration-resistant prostate cancer. Prostate cancer is the third most lethal cancer in the US, with 220,000 new cases and 27,000 deaths projected to occur in 2015. While early detection, surgery and hormone deprivation therapies are ...
